Button & Image Widget Basics in FlutterFlow

Now that we have understood most of the basics, let's quickly review **Button** and **Image** widgets.

Button Widget

When adding a **Button**:

- Most options are similar to what we have already learned (padding, alignment, colors, etc.)

Padding

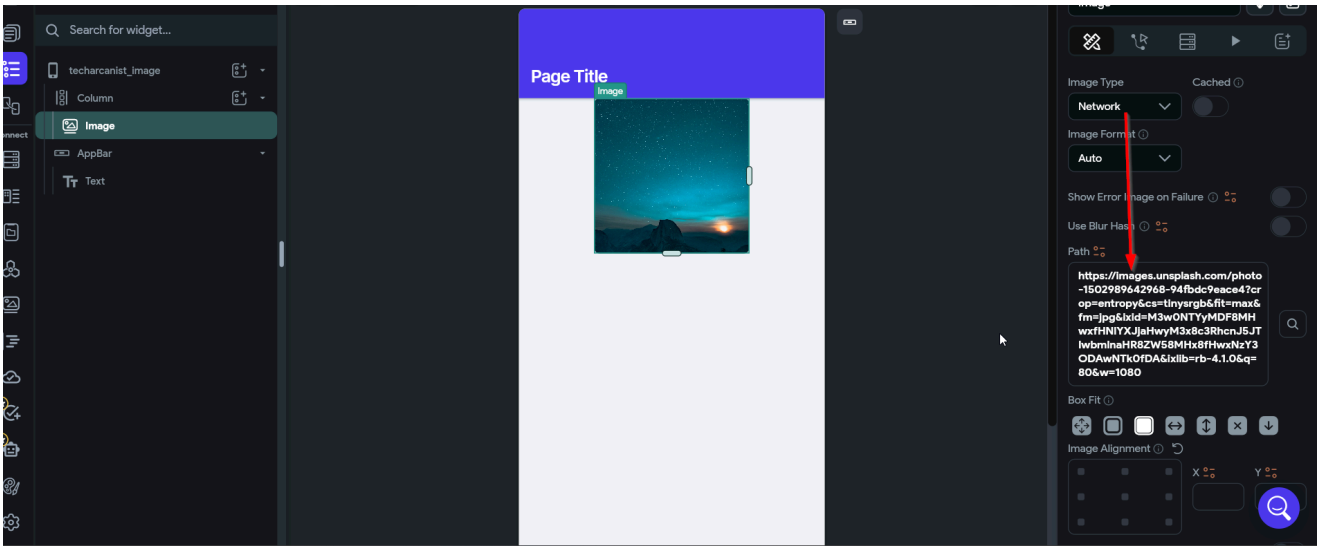

- I used **Inner Padding**
- Set **Left padding = 20**
- This adds space between the **text and the left side of the button**

Icon in Button

- There is also an **Icon option**
- You can easily insert an icon inside the button along with text

---

Image Widget

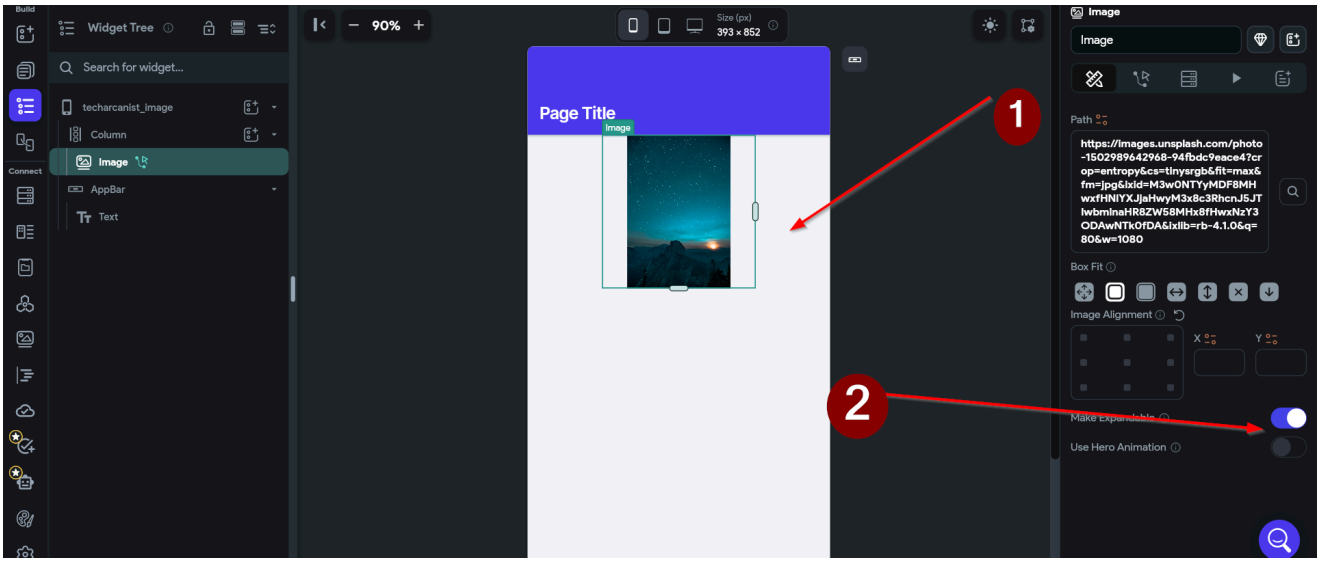

Most image options are already familiar.

Network Image

- This option allows you to load an image using a **URL**
- Useful when images are coming from the internet or an API

Box Fit Options

The **Box Fit** option controls how the image scales inside its container.

Explanation:

1. **Contain**
   - The full image fits inside the box
   - The entire image is visible
   - Empty (white) space may appear on the sides
2. **Expandable (Preview option)**

- Allows the user to tap and view the image in **full screen**
- Useful for galleries and detailed image views
